

a Observed De alignment: four primary archives plus DK boundary

b Shuffled tau nulls fail in all five archives

c Lowland storage coordinates expose the boundary

d Interpretation boundary for Fig. 2

Portability	US/GB/BR positive; AUS weak-positive benchmark claim
Boundary	DK observed-discharge De is negative no universal collapse
Specificity	random tau is negative in all archives not arbitrary scaling
Mechanism	soil-water small-positive; groundwater states negative no direct causality
Null floor	matched AR(1) handled in Fig. 4 separates artifact risk

Figure uses archive-level gauge-bootstrap reductions for portability; the stricter gauge-matched AR(1) null is reported separately in Fig. 4.
