

a Same-point support checks remain positive

b Stochastic AR(1) exceeds observed

c Full-archive analytic nulls define the process boundary

d Interpretation boundary

Coordinate utility Supported

support-matched and shuffled-tau checks

Matched AR(1) excess Not supported

US -45.3 pp; GB -51.0 pp

Analytic two-scale null Boundary

exceeds observed in US and GB

ARFIMA-like relaxation Boundary

d-dependent; can reverse De gain

Use case Retained

model timescale diagnostic, not intercomparison

Conclusion: the benchmark is useful because its artifact floor is explicit.
